

data<sup>RESPONSIBLY</sup>

## *CS 500: Fundamentals of Databases*

# Data, Responsibly

## Introduction to Data Mining

Julia Stoyanovich ([stoyanovich@drexel.edu](mailto:stoyanovich@drexel.edu))

# Data for and about people

# The promise of big data

## Power

Data collection capabilities

Big data: 5Vs (volume, velocity, variety, veracity, value)

enormous computational power

massively parallel processing

## Opportunity

improve people's lives, e.g., recommendation

accelerate scientific discovery, e.g., medicine

boost innovation, e.g., autonomous cars

transform society, e.g., open government

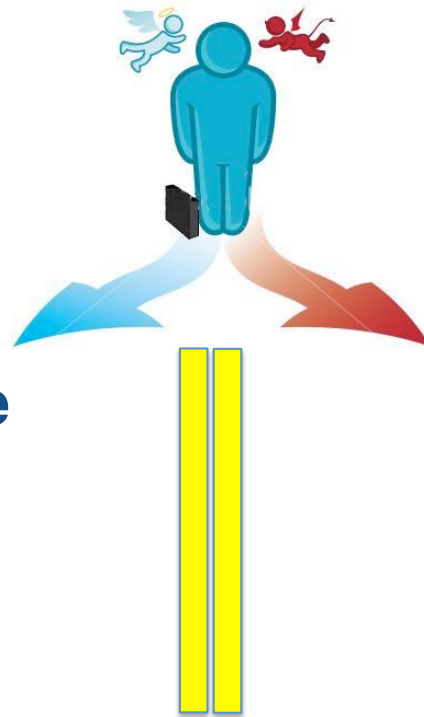

optimize business, e.g., advertisement targeting

**goal - progress**

# Illustration: big data and health

Analysis of a person's medical data, genome, social data

## **personalized medicine**

personalized care and predictive measures

## **personalized insurance**

expensive, or unaffordable, for those at risk

**the same technology makes both possible!**

# Is data analysis objective or impartial?

**Big data is algorithmic, therefore it cannot be biased!** And yet...

- All traditional evils of **discrimination**, and many new ones, exhibit themselves in the big data eco system
- **Bias** that is inherent in the data or in the process, and that is often due to systemic discrimination, is propelled and amplified
- We need novel technological solutions to identify and rectify **irresponsible data analysis practices**
- Technology alone won't do: also need **policy**, **user involvement** and **education** efforts

<http://www.allenoverly.com/publications/en-gb/Pages/Protected-characteristics-and-the-perception-reality-gap.aspx>

# Data, responsibly

Because of its tremendous **power**, massive data analysis must be used **responsibly**

Fairness

Diversity

Transparency

**we focus on fairness today, in a specific interpretation**

# Fairness is lack of bias

- What are the tasks we are interested in?
  - predictive analytics
- Where does bias come from?
  - data collection and analysis
- Analogy - scientific data analysis
  - collect a representative sample
  - do sound reproducible analysis
  - explain data collection and analysis
  - validate results

**when data is about people, bias can lead to discrimination**

# The evils of discrimination

**Disparate treatment** is the illegal practice of treating an entity, such as a creditor or employer, differently based on a **protected characteristic** such as race, gender, age, religion, sexual orientation, or national origin.

**Disparate impact** is the result of systematic disparate treatment, where disproportionate **adverse impact** is observed on members of a **protected class**.

<http://www.allenoverly.com/publications/en-gb/Pages/Protected-characteristics-and-the-perception-reality-gap.aspx>

# Staples online pricing

## THE WALL STREET JOURNAL.

WHAT THEY KNOW

### Websites Vary Prices, Deals Based on Users' Information

By JENNIFER VALENTINO-DEVRIES,  
JEREMY SINGER-VINE and ASHKAN SOLTANI

December 24, 2012

It was the same Swingline stapler, on the same [Staples.com](http://Staples.com) website. But for Kim Wamble, the price was \$15.79, while the price on Trude Frizzell's screen, just a few miles away, was \$14.29.

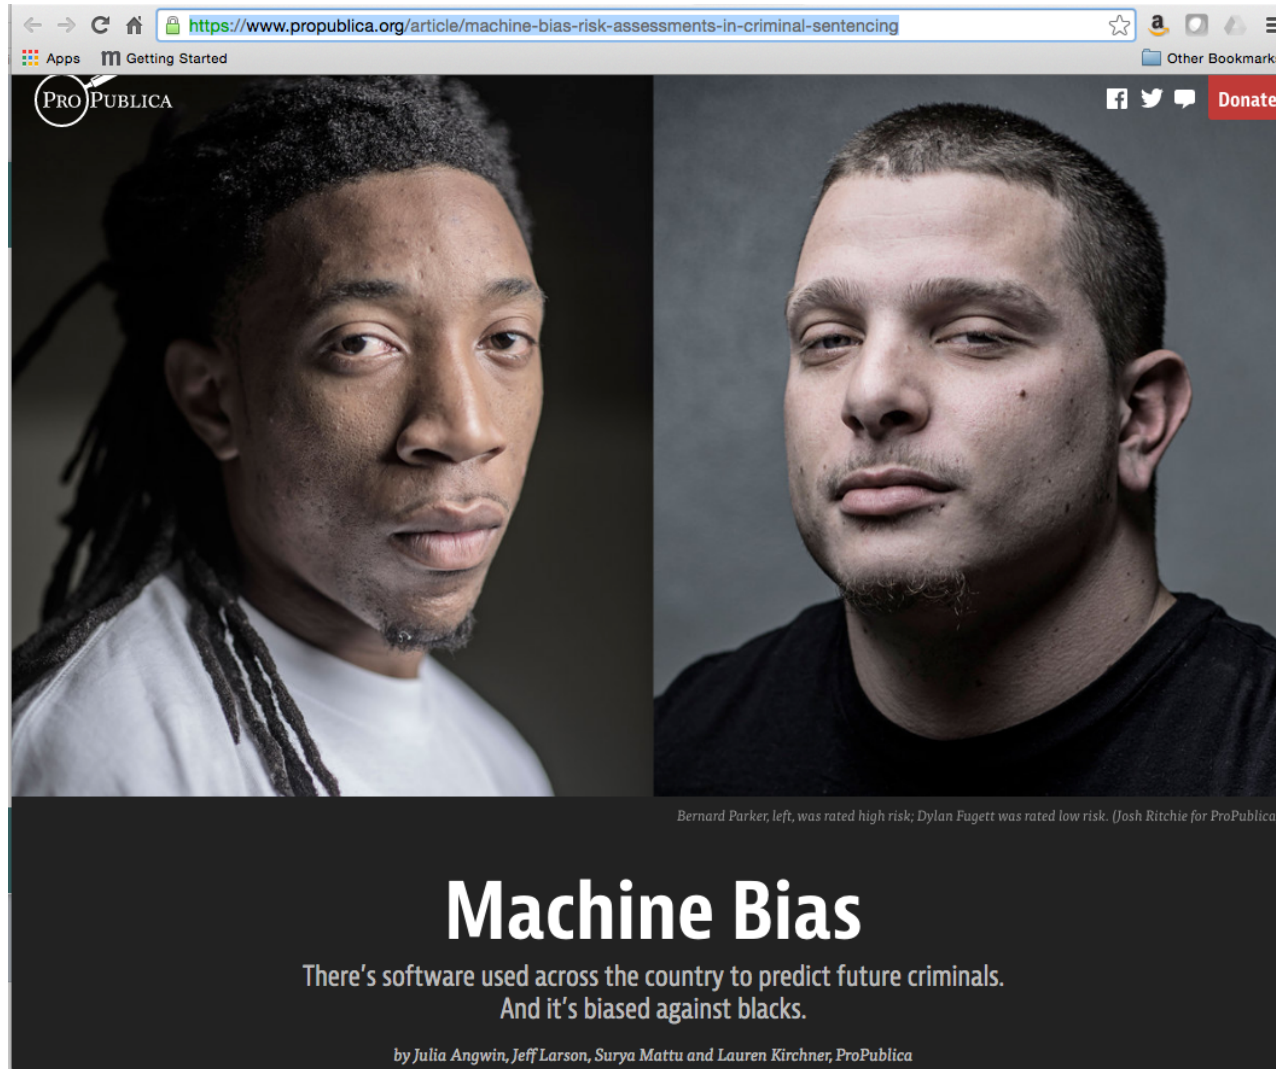

A key difference: where Staples seemed to think they were located.

WHAT PRICE WOULD YOU SEE?

**lower prices offered to buyers who live in more affluent neighborhoods**

# Racial bias in criminal sentencing

The image shows a screenshot of a web browser displaying a ProPublica article. The browser's address bar shows the URL: <https://www.propublica.org/article/machine-bias-risk-assessments-in-criminal-sentencing>. The article's header features two side-by-side portraits of men. The man on the left is Black with dreadlocks, and the man on the right is white with short hair. Below the portraits, the article title "Machine Bias" is prominently displayed in white text on a dark background. Underneath the title, a subtitle reads: "There's software used across the country to predict future criminals. And it's biased against blacks." The authors' names, "by Julia Angwin, Jeff Larson, Surya Mattu and Lauren Kirchner, ProPublica", are listed at the bottom of the article header. The browser interface includes navigation buttons, a search bar, and social media sharing icons.

*Bernard Parker, left, was rated high risk; Dylan Fugett was rated low risk. (Josh Ritchie for ProPublica)*

## Machine Bias

There's software used across the country to predict future criminals.  
And it's biased against blacks.

*by Julia Angwin, Jeff Larson, Surya Mattu and Lauren Kirchner, ProPublica*

<https://www.propublica.org/article/machine-bias-risk-assessments-in-criminal-sentencing>

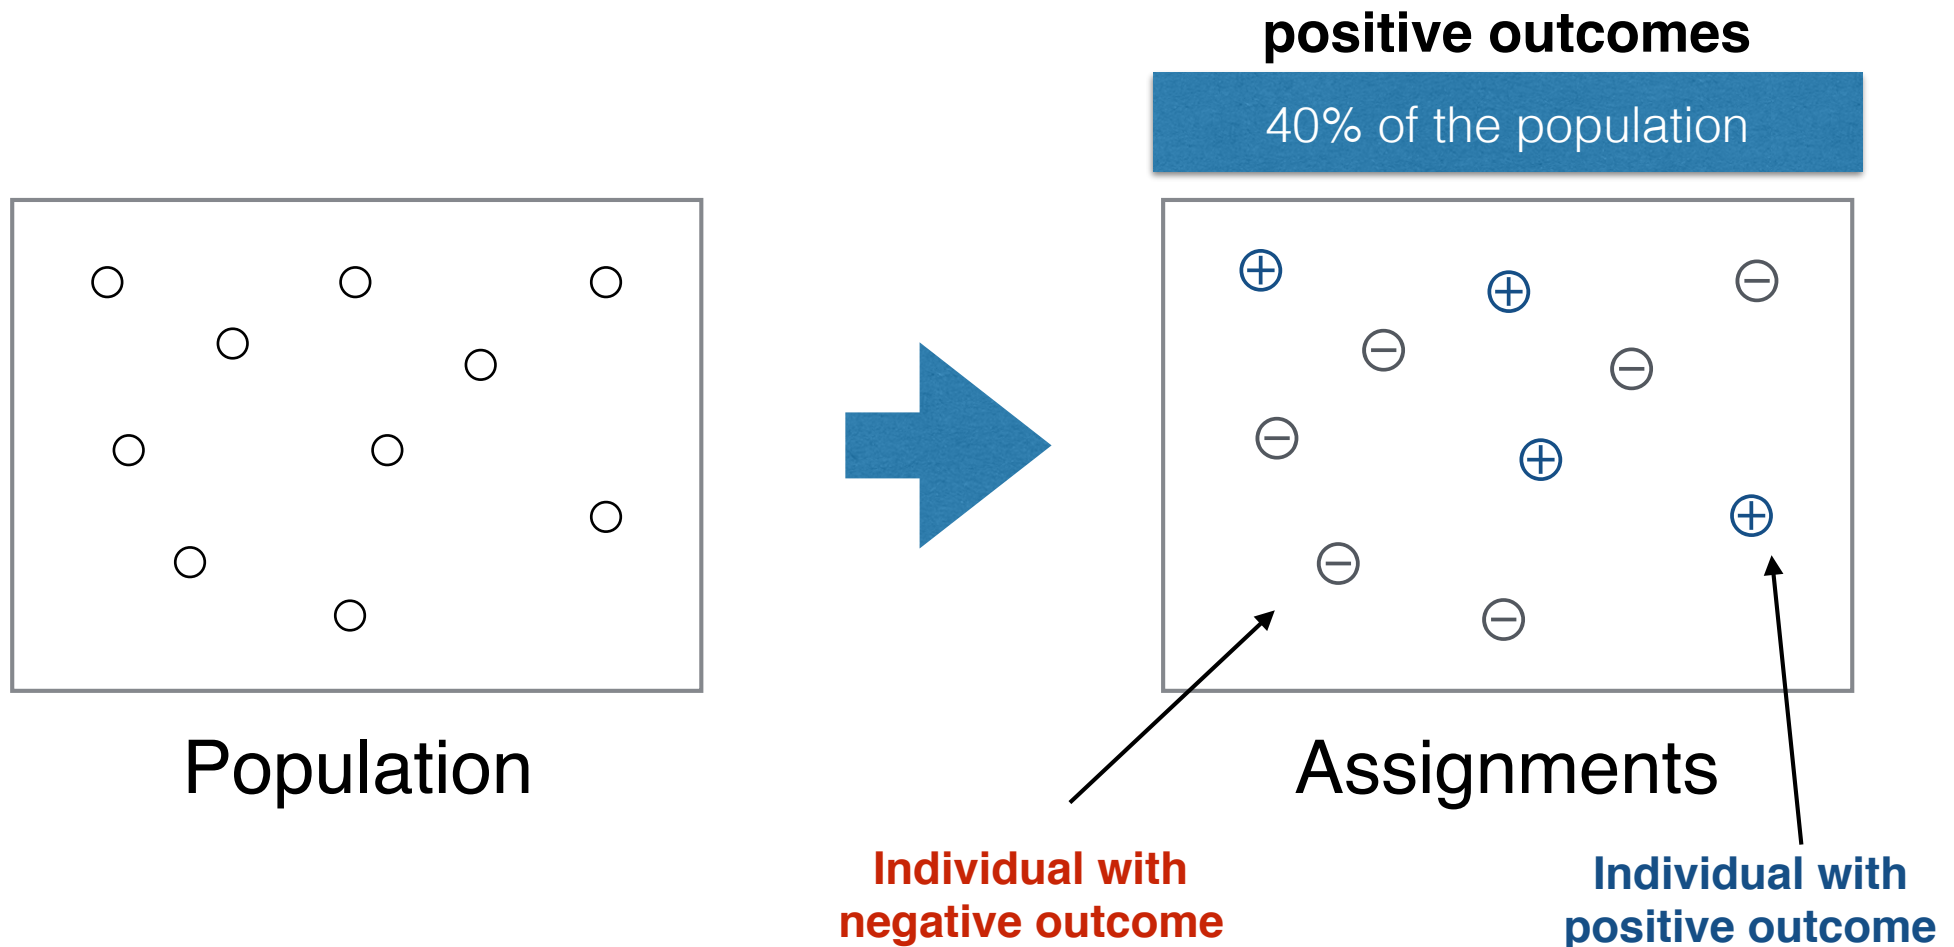

# Outcomes

Consider a **vendor** assigning positive or negative **outcomes** to individuals.

Positive Outcomes	Negative Outcomes
offered employment	denied employment
accepted to school	rejected from school
offered a loan	denied a loan
offered a discount	not offered a discount

# Assigning outcomes to populations

**Fairness** is concerned with how outcomes are assigned to a population

# Sub-populations may be treated differently

**Sub-population:** those with red hair  
(under the same assignment of outcomes)

# Enforcing statistical parity

## Statistical parity (aka group fairness)

demographics of the individuals receiving any outcome are the same as demographics of the underlying population

# Redundant encoding

Now consider the assignments under both **hair color** (protected) and **hair length** (innocuous)

		hair length	
		long	not long
hair color	red	⊕	⊖ ⊖ ⊖ ⊖
	not red	⊕ ⊕ ⊕	⊖ ⊖

**positive outcomes**

- 20% of red haired
- 60% of not red haired

## Deniability

The vendor has adversely impacted red-haired people, but claims that outcomes are assigned according to hair length.

# Blinding does not imply fairness

Removing **hair color** from the vendor's assignment process does not prevent discrimination!

		hair length	
		long	not long
hair color	red	⊕	⊖ ⊖ ⊖ ⊖
	not red	⊕ ⊕ ⊕	⊖ ⊖

**positive outcomes**

- 20% of red haired
- 60% of not red haired

## Assessing disparate impact

Discrimination is assessed by the effect on the protected sub-population, not by the input or by the process that lead to the effect.

# Redundant encoding

Let's replace hair color with **race** (protected),  
hair length with **zip code** (innocuous)

		zip code	
		10025	10027
race	black	⊕	⊖ ⊖ ⊖ ⊖
	white	⊕ ⊕ ⊕	⊖ ⊖

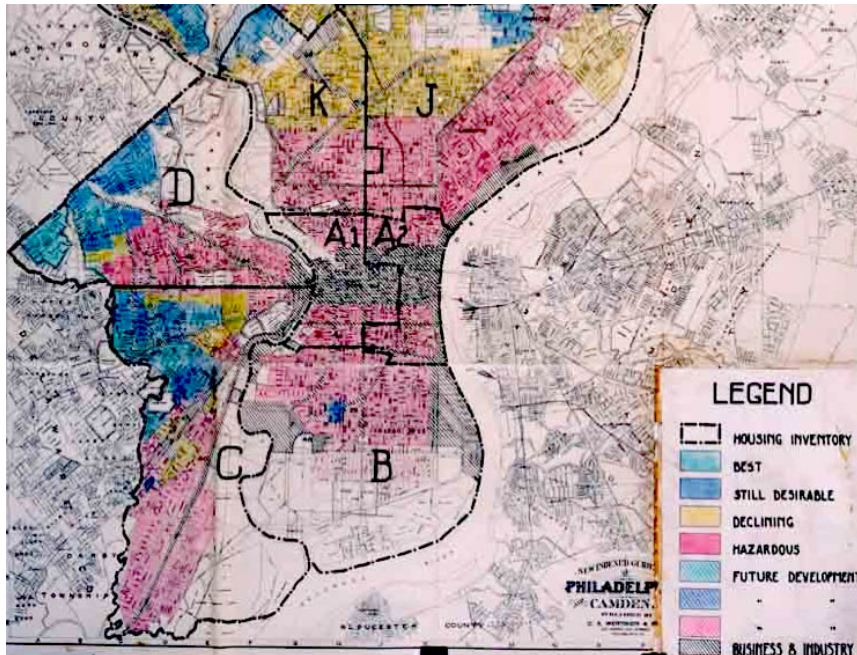

**positive outcomes**

- 20% of black
- 60% of white

# The evils of discrimination

**Redlining** is the practice of arbitrarily denying or limiting financial services to specific neighborhoods, generally because its residents are people of color or are poor.

Philadelphia, 1936

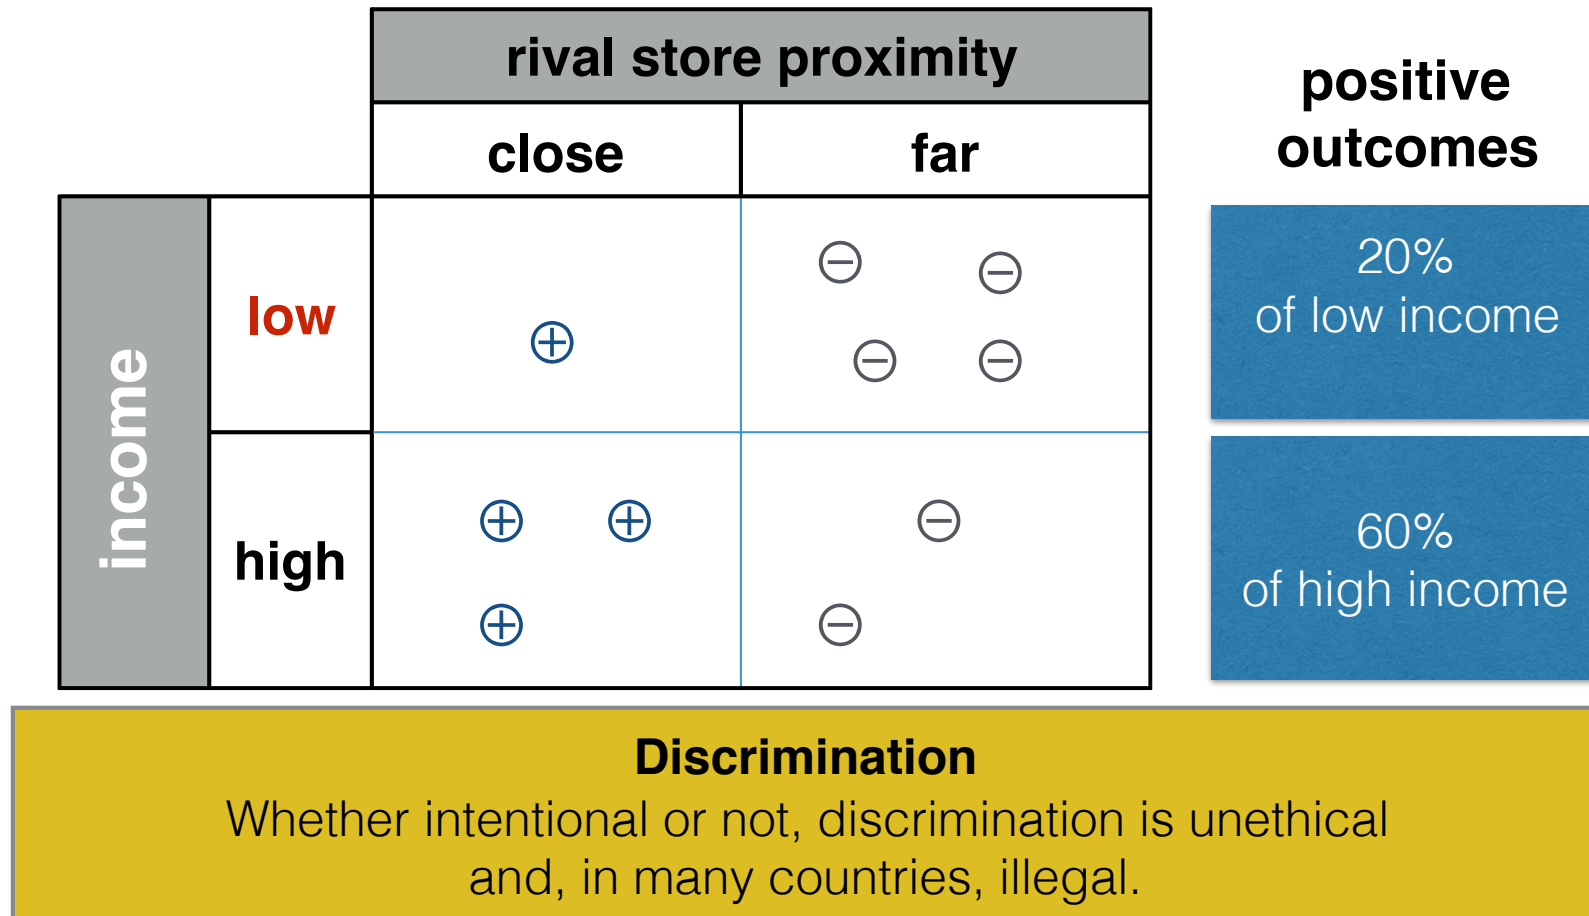

wikipedia

Households and businesses in the red zones could not get mortgages or business loans.

# Discrimination may be unintended

Staples website estimated user's location, **offering discounts** to those near rival stores, leading to discrimination w.r.t. to average income.

# Imposing statistical parity

May be contrary to the goals of the vendor

**positive outcome: offered a loan**

		credit score	
		good	bad
race	black	⊕	⊖ ⊖ ⊕ ⊖
	white	⊕ ⊖ ⊕	⊖ ⊖ ⊖

**positive outcomes**

- 40% of black
- 40% of white

Impossible to predict loan payback accurately.  
Use past information, which may itself be biased.

# Defeating statistical parity

If the vendor wants to avoid offering positive outcomes to red-hairs, they can try to find a disqualifying secondary attribute.

**positive outcome: burger discount**

		diet	
		vegetarian	carnivore
hair color	red	⊕ ⊕ ⊕ ⊕	⊖ ⊖ ⊖ ⊖
	not red	⊖ ⊖ ⊖ ⊖	⊕ ⊖ ⊕ ⊕

  

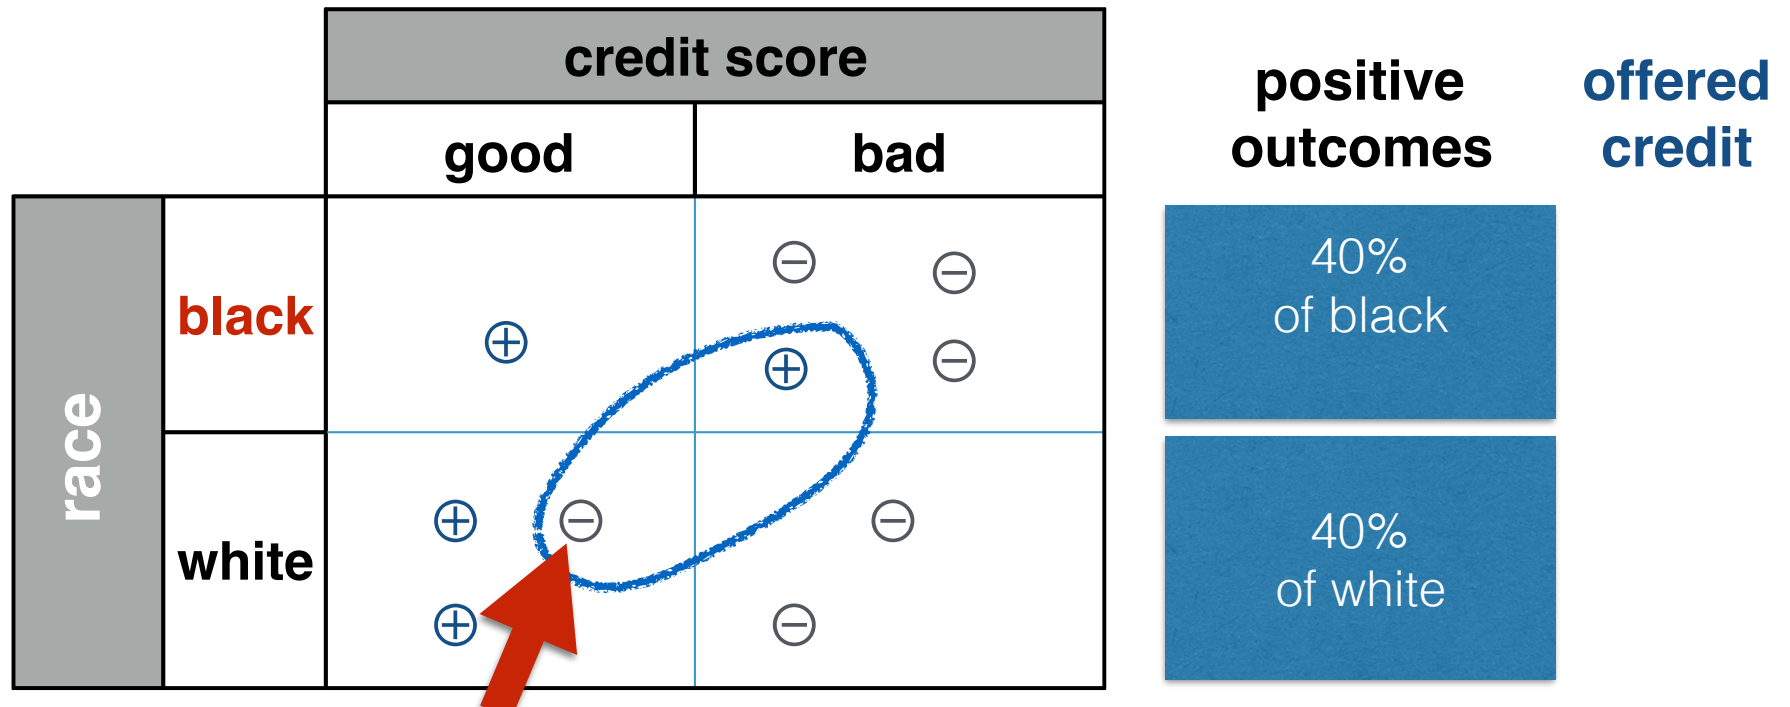

offered	accepted
40% of red haired	0% of red haired
40% of not red haired	40% of not red haired

# Is statistical parity sufficient?

## Statistical parity (aka group fairness)

demographics of the individuals receiving any outcome are the same as demographics of the underlying population

## Individual fairness

any two individuals who are similar w.r.t. a particular task should receive similar outcomes

# How do we quantify discrimination?

		40% of the whole population	<b>positive outcomes</b>	$Y = 1$
hair color	red		20% of red hair	$Y = 1   X^+$
	not red		60% of not red hair	$Y = 1   X^-$

$X^+$  discrete (binary) protected feature  $S$

$X^+$  are members of  $X$  with  $S=1$

$X^-$  are members of  $X$  with  $S=0$

# Let's make things concrete

## Introduction to data mining

# Big data according to T.S. Eliot

Choruses from *The Rock* (1934)

The Eagle soars in the summit of Heaven,  
The Hunter with his dogs pursues his circuit.  
O perpetual revolution of configured stars,  
O perpetual recurrence of determined seasons,  
O world of spring and autumn, birth and dying!

The endless cycle of idea and action,  
Endless invention, endless experiment,  
Brings knowledge of motion, but not of stillness;  
Knowledge of speech, but not of silence;  
Knowledge of words, and ignorance of the Word.  
All our knowledge brings us nearer to death,  
But nearness to death no nearer to God.

*biology*

*astronomy*

*climate & weather*

*population*

*dynamics*

*scientific experimentation*

Where is the Life we have lost in living?  
Where is the wisdom we have lost in knowledge?  
Where is the knowledge we have lost in information?

The cycles of Heaven in twenty centuries  
Brings us farther from God and nearer to the Dust.

*More optimism for the 21st century!*

**1888-1965**

# Knowledge discovery and data mining

“**Knowledge discovery in databases** is the non-trivial process of identifying valid, novel, potentially useful, and ultimately understandable patterns in data.”

“**Data mining** is a step in the KDD process consisting of applying data analysis and discovery algorithms that, under acceptable computational efficiency limitations, produce a particular enumeration of patterns over the data.”

Fayyad et al., 1996.

# Knowledge discovery and data mining

- Why we need data mining
  - "Drowning in data yet starving for knowledge", anonymous
  - "Computers have promised us a fountain of wisdom but delivered a flood of data", W. J. Frawley, G.Piatetsky-Shapiro, and C. J. Matheus
  - "Where is the wisdom we have lost in knowledge? Where is the knowledge we have lost in information?", T. S. Eliot
- What data mining is not
  - Data mining, noun: "Torturing data until it confesses ... and if you torture it enough, it will confess to anything", Jeff Jonas, IBM
  - "An unethical econometric practice of massaging and manipulating the data to obtain the desired results", W.S. Brown "Introducing Econometrics"

From [http://www.cs.ccsu.edu/~markov/ccsu\\_courses/DataMining-1.html](http://www.cs.ccsu.edu/~markov/ccsu_courses/DataMining-1.html)

# Some types of data mining

- Association rule mining - today's lecture
  - e.g., 72% of customers who bought cookies also bought milk
- Classification - related to association rule mining, today's lecture
  - e.g., is a new customer applying for a loan a good investment or not?
    - If STATUS = married and INCOME > 50K and HOUSE\_OWNER = yes
    - Then GRANT\_LOAN = yes
- Finding sequential / temporal patterns
  - e.g., find the set of genes that are differentially expressed, and whose expression precedes the onset of a disease
- Clustering
  - Similar to classification, but classes are not known ahead of time

# Association rule mining

- Proposed by Agrawal, Imielinski and Swami in SIGMOD 1993
- The now-classic Apriori algorithm by Agrawal and Srikant was published in VLDB 1994, received the 10-year best paper award at VLDB 2004
- Initially used for market basket data analysis, but has many other applications
- Answers two related questions
  1. Which items are often purchased together?
    - frequent itemsets, e.g., [Milk](#), [Cookies](#)
    - have an associated **support**
  2. Which items will likely be purchased, based on other purchased items?
    - association rules, e.g., [Diapers => Beer](#)
    - meaning: if diapers are bought in a transaction, beer is also likely bought in the same transaction.
    - each association rule is derived from two frequent itemsets
    - have an associated **support** and **confidence**

# The model: market-basket data

- $I = \{i_1, i_2, \dots, i_m\}$  is the set of available items, e.g., a product catalog of a store
- Transaction  $t$  is a set of items purchased together,  $t \subseteq I$ , has a transaction id (TID)
  - $t_1: \{\text{bread, cheese, milk}\}$
  - $t_2: \{\text{apple, eggs, salt, yogurt}\}$
  - $t_3: \{\text{biscuit, cheese, eggs, milk}\}$
- Database  $T$  is a set of transactions  $\{t_1, t_2, \dots, t_n\}$

**What is not represented by this model?**

# Itemsets

$X \subseteq I$  is an **itemset**

$X = \{\text{milk, bread, cereal}\}$  is an itemset

$X$  is a 3-itemset (a  $k$ -itemset with  $k=3$ )

$X$  has **support**  $\text{supp}$  if  $\text{supp}\%$  of transactions contain  $X$

A transaction  $t$  contains an itemset  $X$  if  $X \subseteq t$

$t$  is said to give support to  $X$

A user specifies a support threshold  $\text{minSupp}$

Itemsets with support  $\geq \text{minSupp}$  are **frequent itemsets**

# Example

TID	Items
1	A
2	A C
3	A B D
4	A C
5	A B C
6	A B C

minSupp = 20% at least 2 transactions

How many possible item sets are there?

$$2^4 = 16$$

	itemset	support
★	A	100%
★	B	50%
★	C	67%
	D	17%
<hr/>		
★	A B	50%
★	A C	67%
	A D	17%
★	B C	33%
	B D	17%
	C D	0
<hr/>		
★	A B C	33%
	A B D	17%
	B C D	0
	A C D	0
<hr/>		
	A B C D	0

# Association Rules

An **association rule** is an implication  $X \rightarrow Y$ , where  $X, Y \subset I$ , and  $X \cap Y = \emptyset$

example:  $\{\text{milk, bread}\} \rightarrow \{\text{cereal}\}$

“A customer who purchased X is also likely to have purchased Y in the same transaction”

we are interested in rules with a **single item** in Y

can we represent  $\{\text{milk, bread}\} \rightarrow \{\text{cereal, cheese}\}$ ?

Rule  $X \rightarrow Y$  holds with **support**  $supp$  in T if  $supp$  % of transactions contain  $X \cup Y$

$$supp \approx \Pr(X \cup Y)$$

Rule  $X \rightarrow Y$  holds with **confidence**  $conf$  in T if  $conf$  % of transactions that contain X also contain Y

$$conf \approx \Pr(Y | X)$$

$$conf(X \rightarrow Y) = supp(X \cup Y) / supp(X)$$

# Example

minSupp = 20% at least 2 transactions

minConf = 75%

supp = 50%

$A \rightarrow B$  conf = 50% / 100% = 50%

$B \rightarrow A$  conf = 50% / 50% = 100% ★

supp = 50%

$B \rightarrow C$  conf = 100% ★

$C \rightarrow B$  conf = 75% ★

supp = 67%

$A \rightarrow C$  conf = 67%

$C \rightarrow A$  conf = 100% ★

supp = 33%

$AB \rightarrow C$  conf = 67%

$AC \rightarrow B$  conf = 50%

$BC \rightarrow A$  conf = 100%

itemset	support
★ A	100%
★ B	50%
★ C	67%
D	17%
★ A B	50%
★ A C	67%
A D	17%
★ B C	33%
B D	17%
C D	0
★ A B C	33%
A B D	17%
B C D	0
A C D	0
A B C D	0

# Association Rule Mining

- Goal: find all association rules that satisfy the user-specified minimum support and minimum confidence
- Algorithm outline
  - Step 1: find all frequent itemsets
  - Step 2: find association rules
- Take 1: naïve algorithm for frequent itemset mining
  - Enumerate all subsets of  $I$ , check their support in  $T$
  - **What is the complexity?**
  - **Any obvious optimizations?**

# Downward Closure

- Recall: a frequent itemset has support  $\geq$  minSupp
- Key idea: Use the downward closure property**
  - all subsets of a frequent itemset are themselves frequent
  - conversely: if an itemset contains any infrequent itemsets as subsets, it cannot be frequent (we know this a priori)
  - Is an itemset necessarily frequent if all its subsets are frequent?
    - No!**  $\text{supp}(X \cup Y) \leq \min(\text{supp}(X), \text{supp}(Y))$

	itemset	support
★	A	100%
★	B	50%
★	C	67%
	D	17%
★	A B	50%
★	A C	67%
	A D	17%
★	B C	33%
	B D	17%
	C D	0
★	A B C	33%
	A B D	17%
	B C D	0
	A C D	0
	A B C D	0

# The *Apriori* Algorithm

## Algorithm *Apriori*( $T$ )

```
 $F_1 = \{\text{frequent 1-itemsets}\};$   
for ( $k = 2; F_{k-1} \neq \emptyset; k++$ ) do  
     $C_k \leftarrow \text{candidate-gen}(F_{k-1});$   
    for each transaction  $t \in T$  do  
        for each candidate  $c \in C_k$  do  
            if  $c$  is contained in  $t$  then  
                 $c.\text{count}++;$   
            end  
        end  
    end  
     $F_k \leftarrow \{c \in C_k \mid c.\text{count}/n \geq \text{minsup}\}$   
end  
return  $F \leftarrow \bigcup_k F_k;$ 
```

# Apriori candidate generation

The **candidate-gen** function takes  $F_{k-1}$  and returns a **superset** (called the candidates) of the set of all frequent **k-itemsets**. It has two steps:

**Join:** generate all possible candidate itemsets  $C_k$  of length  $k$

**Prune:** remove those candidates in  $C_k$  that have infrequent subsets

**Which subsets do we check?**

# Apriori candidate generation

Assume a lexicographic ordering of the items

## Join

Insert into  $C_k$

Select  $p.item_1, p.item_2, \dots, p.item_{k-1}, q.item_{k-1}$

From  $F_{k-1} p, F_{k-1} q$

Where  $p.item_1 = q.item_1$

And  $p.item_2 = q.item_2$

And ....

And  $p.item_{k-1} < q.item_{k-1}$  **Why not  $p.item_{k-1} \neq q.item_{k-1}$ ?**

## Prune

for each  $c$  in  $C_k$  do

  for each  $(k-1)$  subset  $s$  of  $c$  do

    if ( $s$  not in  $F_{k-1}$ ) then

      delete  $c$  from  $C_k$

# Generating association rules

for each frequent  $k$ -itemset  $X$

for each 1-itemset  $A \subset X$

compute  $\text{conf}(X-A \rightarrow A) = \text{supp}(X) / \text{supp}(X-A)$

if  $\text{conf}(X-A \rightarrow A) \geq \text{minConf}$  then  $X-A \rightarrow A$  is an association rule

see slide 34 for an example

How are association rules different from functional dependencies in relational databases?

# Performance of *Apriori*

- The possible number of frequent itemsets is exponential,  $O(2^m)$ , where  $m$  is the number of items
- Apriori exploits sparseness and locality of data
  - Still, it may produce a large number of rules: thousands, tens of thousands, ....
  - So, thresholds should be set carefully. **What are some good heuristics?**
- Let's take another look at the algorithm

# The *Apriori* Algorithm

## Algorithm Apriori( $T$ )

$F_1 = \{\text{frequent 1-itemsets}\};$

**for** ( $k = 2; F_{k-1} \neq \emptyset; k++$ ) **do**

$C_k \leftarrow \text{candidate-gen}(F_{k-1});$

**for each transaction**  $t \in T$  **do**     // a full scan of  $T$  for each  $k!$

**for each candidate**  $c \in C_k$  **do**

**if**  $c$  is contained in  $t$  **then**

$c.\text{count}++;$

**end**

**end**

$F_k \leftarrow \{c \in C_k \mid c.\text{count}/n \geq \text{minsup}\}$

**end**

return  $F \leftarrow \bigcup_k F_k;$

# The *AprioriTid* Algorithm

## Algorithm *AprioriTid*( $T$ )

```
 $F_1 = \{\text{frequent 1-itemsets}\}; \quad T_1 = T;$   
for ( $k = 2; F_{k-1} \neq \emptyset; k++$ ) do  
     $C_k \leftarrow \text{candidate-gen}(F_{k-1});$   
     $T_k = \{\}$   
    for each transaction  $t \in T_{k-1}$  do  
         $C_k^t = \{\text{itemsets in } C_k \text{ to which } t \text{ gives support}\}$   
        for each candidate  $c \in C_k^t$  do  
             $c.\text{count}++;$   
        end  
         $T_k = T_k \cup \langle t.TID, C_k^t \rangle$   
    end  
     $F_k \leftarrow \{c \in C_k \mid c.\text{count}/n \geq \text{minsup}\}$   
end  
return  $F \leftarrow \bigcup_k F_k;$ 
```

# AprioriTid example

minSupp = 30%

TID	set of itemsets
1	{{A}}
2	{{A}, {C}}
3	{{A}, {B}, {D}}
4	{{A}, {C}}
5	{{A}, {B}, {C}}
6	{{A}, {B}, {C}}

F1 = {A} {B} {C}

C2 = {AB} {AC} {BC}

T2

TID	set of itemsets
2	{{A C}}
3	{{A B}}
4	{{A C}}
5	{{AB}, {AC}, {BC}}
6	{{AB}, {AC}, {BC}}

F3 = {AB} {AC} {BC}

C3 = {ABC}

T3

TID	set of itemsets
5	{{A B C}}
6	{{A B C}}

# *Apriori vs. AprioriTid*

## Any guesses as to the relative performance?

The goal is to avoid scanning the database  $T$

So, we are computing and carrying around a redundant data structure that contains a sub-set of  $T$ , in conveniently pre-processed form

When does this NOT help performance? For small  $k$ ? For large  $k$ ?

# So, why the 10-year best paper award?

- Why is this such a big deal?
  - A fairly simple model
  - A fairly simple bottom-up algorithm
  - A fairly obvious performance optimization
  - No pretty optimality proof
- But this is only simple in hindsight! Plus....
  - The algorithm works well in practice
  - Many real applications
  - Many possible useful extensions

# From association rules to classification

T: database of transactions  
(market-basket data)

TID	items
100	shirt
200	jacket, shoes, boots
300	pants, boots
400	shoes
500	shoes
600	jacket

D: database of profiles of individuals  
(dating, employment, credit, criminal)

UID	gender	age	score
Ann	F	31	low
Bob	M	27	high
Cate	F	55	high
Dave	M	43	low

TD: database of profiles of individuals, transformed  
to look like transactions

UID	attributes
Ann	gender=F, age $\in$ [30,35), score=low
Bob	gender=M, age $\in$ [25,30), score=high
Cate	gender=F, age $\in$ [55, 60), score=high
Dave	gender=M, age $\in$ [40, 45), score=low

# Classification association rules (CARs)

D: database of individuals

UID	sex	age	score
Ann	F	31	<b>low</b>
Bob	M	27	<b>high</b>
Cate	F	55	<b>high</b>
Dave	M	43	<b>low</b>

TD: database of individuals that looks like transactions

UID	attributes
Ann	gender=F, age $\in$ [30,35), <b>score=low</b>
Bob	gender=M, age $\in$ [25,30), <b>score=high</b>
Cate	gender=F, age $\in$ [55, 60), <b>score=high</b>
Dave	gender=M, age $\in$ [40, 45), <b>score=low</b>

$S X \rightarrow C$   $X$  is a set of attribute-value pairs, and  $c \in C$  is a (binary) outcome

in our example, *score* is the outcome (low or high), also called the class label

continuous attribute values must be discretized (mapped to buckets)  
as part of the transformation - age in our example

# Potentially discriminatory rules (PD-CARs)

D: database of individuals

UID	gender (S)	age (X1)	edu (X2)	score (C)
Ann	<b>F</b>	[30,35)	BS	<b>low</b>
Bob	<b>M</b>	[25,30)	MS	<b>high</b>
Cate	<b>F</b>	[55, 60)	PhD	<b>high</b>
Dave	<b>M</b>	[40, 45)	BS	<b>low</b>

- $S X \rightarrow C$
- $S$  is a binary attribute-value assignment - membership in a protected group (gender in our example)
  - $X$  is a set of “regular” attribute-value pairs (age and edu in our example)
  - $C$  is a binary attribute-value assignment - classification outcome (score in our example)

# Potentially discriminatory rules (PD-CARs)

R:  $S X \rightarrow C$

UID	gender (S)	age (X1)	edu (X2)	score (C)
Ann	<b>F</b>	[30,35)	BS	<b>low</b>

$S$  binary membership in a protected group (gender)

$X$  “regular” attribute-value pairs (age and edu)

$C$  binary classification outcome (score)

support ( $S X \rightarrow C$ ) = % D that assigns the same attribute values for S, X and C

confidence ( $S X \rightarrow C$ ) = support ( $S X \rightarrow C$ ) / support ( $S X$ )

$\alpha$ -protection ( $S X \rightarrow C$ ) = confidence ( $S X \rightarrow C$ ) / confidence ( $X \rightarrow C$ )

# Homework 6

- Read about the ProPublica COMPAS investigation here <https://www.propublica.org/article/machine-bias-risk-assessments-in-criminal-sentencing> and here <https://www.propublica.org/article/how-we-analyzed-the-compas-recidivism-algorithm>
- Download the post-processed subset of the ProPublica COMPAS dataset from the course website, and load it into your PostgreSQL database on tux
- Write a sequence of SQL queries that takes as input support, confidence and protection thresholds and outputs all PD-CARs that pass the specified thresholds
  - assume that *race* is the protected attribute and that *v-decile* (medium or high violent decile score) is the outcome
  - assume that “regular” attributes are *gender*, *marriage* and *age*, and that *age* is discretized appropriately (you don’t need to do any data post-processing)
  - use SQL code provided on the course website as your starting point, do not change the format of the output

# Data, responsibly

Because of its tremendous **power**, massive data analysis must be used **responsibly**

Fairness

Diversity

Transparency

# Data analysis in context

- A touch of probability and statistics
  - Events and outcomes
  - Independent and non-independent events
  - Avoiding the pitfalls: the 4 Cs, Bonferroni principle and Oakham's razor

# Probability and Statistics

- Experiments have outcomes
- An event is an occurrence of a set of outcomes
- Probability of an event measures how likely this event is to occur

Example: tossing a fair coin, on Earth, subject to the usual gravity laws

Experiment: toss the coin once

Outcomes: {H, T}

Events: {H}, {T}, {} - neither heads nor tails, {H,T} - either heads or tails

Probabilities of events:  $P(\{H\}) = 0.5$   $P(\{T\}) = 0.5$ ,  $P(\{\}) = 0$ ,  $P(\{H,T\}) = 1$

Probabilities of disjoint events:  $P(\{H\}) = 0.5$   $P(\{T\}) = 0.5$

**What changes if the coin is biased?**

**What if our experiment is to toss the coin twice?**

# Independent Events

Events A and B are independent if the fact that A occurs does not affect the probability of B occurring.

Experiment: toss 2 fair coins, call them A and B.

We write  $A=1$  if A lands heads,  $A=0$  if A lands tails.

Outcomes:  $\{A=0, B=0\}$ ,  $\{A=0, B=1\}$ ,  $\{A=1, B=0\}$ ,  $\{A=1, B=1\}$

$$P(A) = 1/2 \quad P(B) = 1/2$$

$$P(A, B) = 1/4$$

$$P(A, B) = P(A) P(B)$$

**More than 2 independent events?**

# Conditional probability

Conditional probability measures the probability of an event given that another event has occurred.

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

Example: S - probability that a person smokes; A - probability that there is an ashtray in the person's home

$$|U| = 100 \text{ people}$$

$$|S| = 15 \text{ smokers}$$

$$|A| = 20 \text{ have ashtrays in their home}$$

$$|A \text{ and } S| = 10$$

# Conditional probability

Conditional probability measures the probability of an event given that another event has occurred.

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

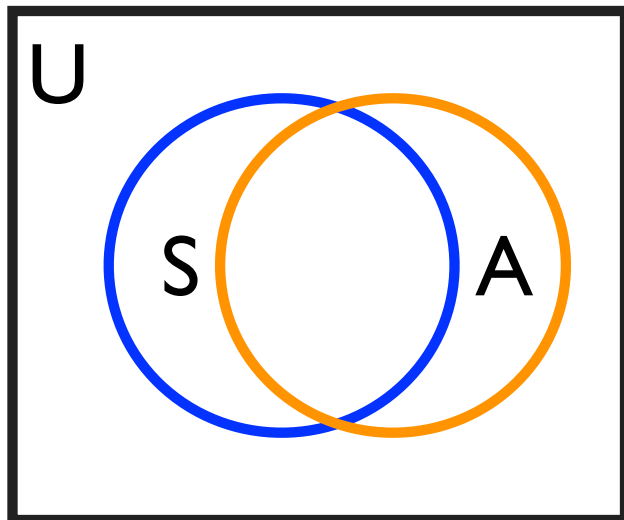

Example: S - probability that a person smokes; A - probability that there is an ashtray in the person's home

$$P(S) = 0.15 \quad P(A) = 0.2$$

$$P(S \text{ and } A) = 0.1$$

$$P(S | A) = 0.1 / 0.2 = 0.5$$

$$P(A | S) = 0.1 / 0.15 = 0.67$$

$$\text{Baye's rule: } P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

# Co-occurrence

Co-occurrence: events A and B *frequently* occur together

An event is an assignment of a value to a variable (age, edu, income, astrological sign)

An experiment is a particular tuple in the database

Outcomes:

$$\text{dom}(A) \times \text{dom}(E) \times \text{dom}(I) \times \text{dom}(S)$$

$$P(\text{sign} = \text{Taurus AND edu} = \text{BS}) = 5\%$$

$$P(\text{sign} = \text{Taurus AND edu} = \text{HS}) = 2\%$$

age	edu	inc	sign
20	BS	27K	Aries
35	MS	102K	Taurus
62	PhD	200K	Virgo
70	BS	80K	Leo
...	...	...	...

*is 5% frequent?*

*is 2% frequent?*

# Co-occurrence

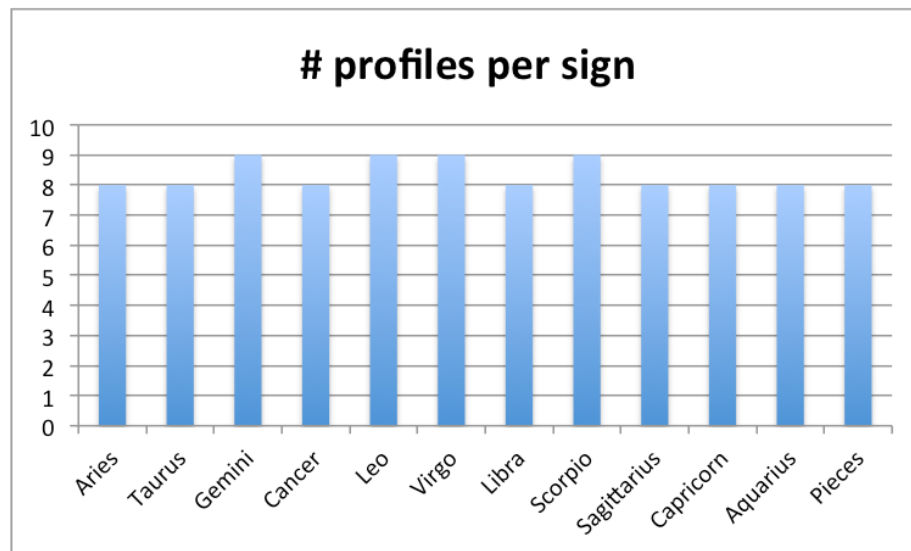

Co-occurrence: events A and B *frequently* occur together

$P(\text{sign} = \text{Taurus AND edu} = \text{BS}) = 5\%$

*is 5% frequent?*

$P(\text{sign} = \text{Taurus AND edu} = \text{HS}) = 2\%$

*is 2% frequent?*

# Co-occurrence vs. correlation

Co-occurrence: events A and B *frequently* occur together

Correlation: events A and B occur together *more frequently than by random chance*

$$P(\text{sign} = \text{Taurus}) = 8\%$$

Considerations of *model* and *sample size*!

# Co-occurrence vs. correlation

Co-occurrence: events A and B *frequently* occur together

Correlation: events A and B occur together *more frequently than by random chance*

$P(\text{sign} = \text{Cancer AND edu} = \text{PhD}) = 2\%$

$P(\text{sign} = \text{Libra AND edu} = \text{PhD}) = 0$

Considerations of *model* and *sample size*!

# Correlation vs. causation

Co-occurrence: events A and B *frequently* occur together

Correlation: events A and B occur together *more frequently than by random chance*

Causation: if event A occurs, then event B is *more likely to occur*

# Correlation vs. causation

For correlated events A and B, the following relationships are possible

1. A causes B (direct causation)
2. B causes A (reverse causation)
3. A and B are consequences of a common cause
4. A causes B and B causes A (cyclic causation)

# Causation vs. coincidence

see also <http://www.tylervigen.com/spurious-correlations>  
for lots of fun examples

# Bonferroni principle

In massive datasets, unusual events may appear, **by coincidence**, to be more frequent than expected. If the expected frequency of an event is lower than what is expected by random chance - the event cannot be reliably detected!

Example (sec 1.2.3 of LRU): “evil-doers” gather at hotels to plan evil deeds. A pair of people who is at the same hotel on 2 or more occasions are potentially evil-doers.

There are  $10^{12}$  people (1 billion). Everyone decides with probability 0.01 to stay at a random hotel on any given day. There are  $10^5$  hotels. We examine 1000 days worth of hotel records.

**What is the probability that 2 people will visit the same hotel on 2 separate occasions?**

$$5 \times 10^{17} \times 5 \times 10^5 \times 10^{-18} = 250,000$$

# Oakham's razor

## Lex parsimoniae

If multiple hypotheses explain an observation, the simplest one should be preferred.

Used as a heuristic to help identify a promising hypothesis to test

Ockham's motivation: can one prove the existence of God?

Many applications today: biology, probability theory, ethics

**William of Ockham  
(1285-1347)**

# An example: the art of medical diagnosis

"It's your ribs. I'm afraid they're delicious." - New Yorker Cartoon  
By: Paul Noth Item #: 10684223

# An example: overfitting

vs.

# How to lie with Big Data

statistics

**BIG DATA**

Statistics scares people, big data REALLY scares people!

# Learn to question!

- Concepts
  - **understanding** data acquisition methods and data analysis processes
  - **verifying** the data and the process: provenance, credit attribution, trust
  - **interpreting** results

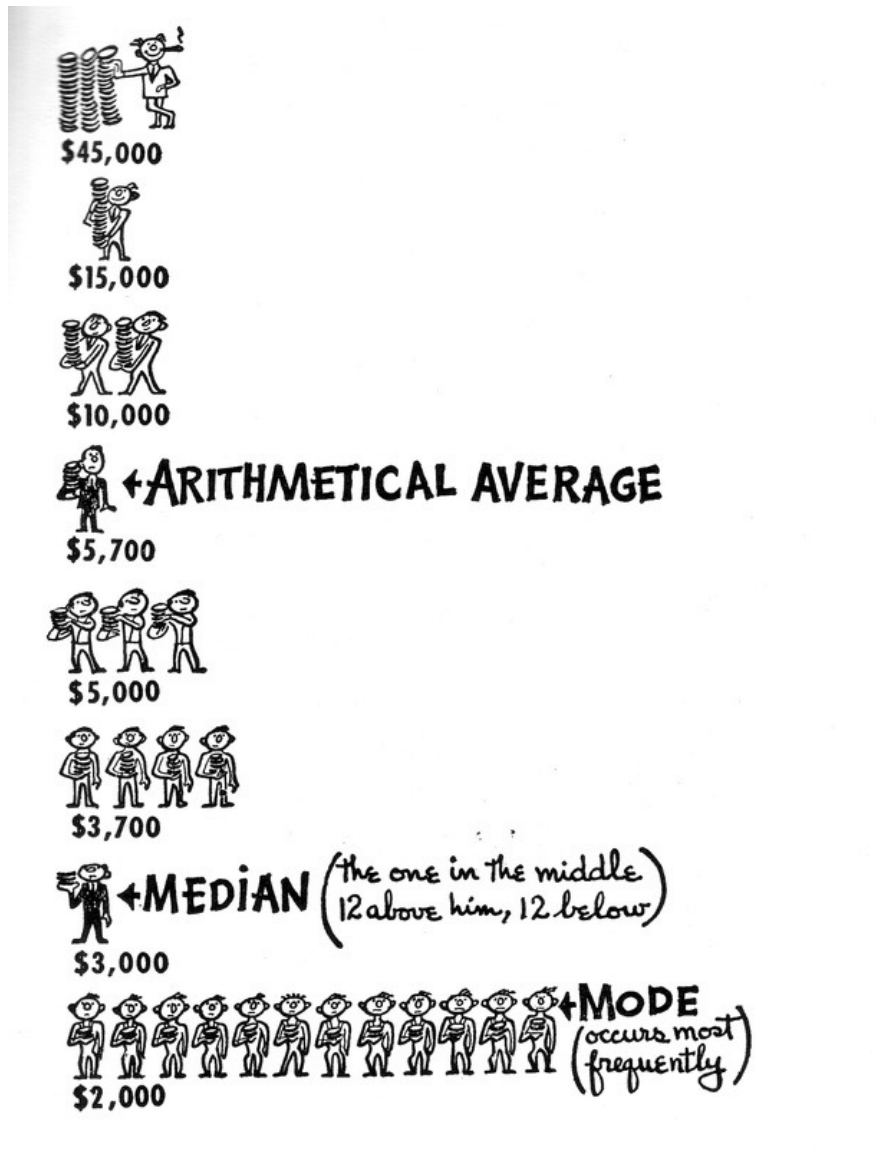

# Case study: musicians and mortality

# Is data science a science?

[http://bioserv.fiu.edu/~walterm/human\\_online/labs/scientific\\_meth/sci\\_meth1/scientific\\_method\\_files/image001.gif](http://bioserv.fiu.edu/~walterm/human_online/labs/scientific_meth/sci_meth1/scientific_method_files/image001.gif)

# The scientific method

A method or procedure that has characterized natural science since the 17th century, consisting in systematic observation, measurement, and experiment, and the formulation, testing, and modification of hypotheses.

*The Oxford English Dictionary*

- **hypothesis is formulated** based on observation
- **hypothesis is tested** under controlled conditions using sound reasoning
- **avoids confirmation bias** - people tend to observe what they expect to observe
- the process is **reproducible**

# Falsifiability

A crucial component of the scientific method - every hypothesis must be falsifiable (refutable, testable), i.e., it must be possible to prove that the statement in question is false

# Is astrology a science?

[http://www.bodymemory.com/uploads/2/3/2/8/23288628/s266135201567006809\\_p25\\_i2\\_w1000.jpeg](http://www.bodymemory.com/uploads/2/3/2/8/23288628/s266135201567006809_p25_i2_w1000.jpeg)

# Data, responsibly

Because of its tremendous **power**, massive data analysis must be used **responsibly**

Fairness

Diversity

Transparency

**let's look at diversity next**

# Illustration: online dating

**Dating query:** female, 40 or younger, at least some college, in order of decreasing income

**Results** are homogeneous at top ranks

Both the seeker (asking the query) and the matches (results) are dissatisfied

Crowdsourcing, crowdfunding, ranking of Web search results, ... - all subject to this problem

**the rich get richer, the poor get poorer**

MBA, 40 years old  
makes \$150K

MBA, 40 years old  
makes \$150K

MBA, 40 years old  
makes \$150K

MBA, 40 years old  
makes \$150K

... 999 matches

PhD, 36 years old  
makes \$100K

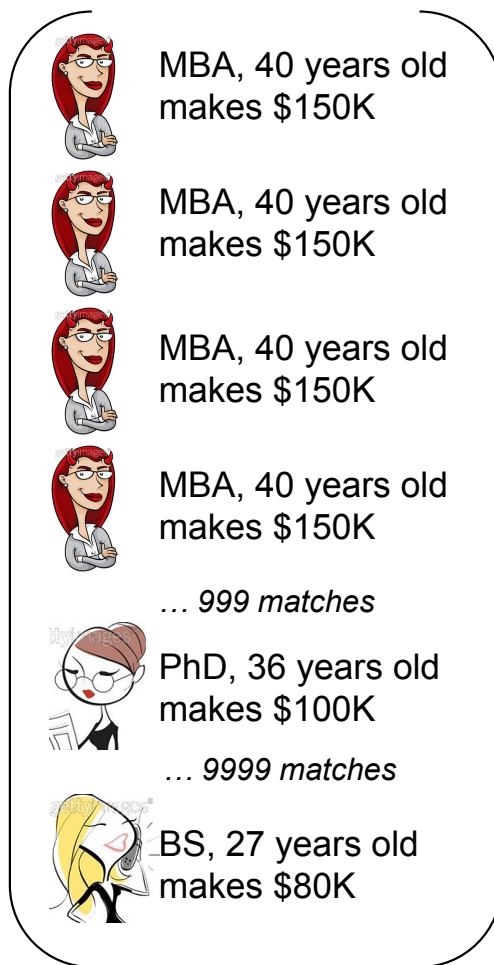

... 9999 matches

BS, 27 years old  
makes \$80K

# Rank-aware clustering

Return clusters that expose **best from among comparable** items (profiles) w.r.t. user preferences

MBA, 40 years old  
makes \$150K

MBA, 40 years old  
makes \$150K

MBA, 40 years old  
makes \$150K

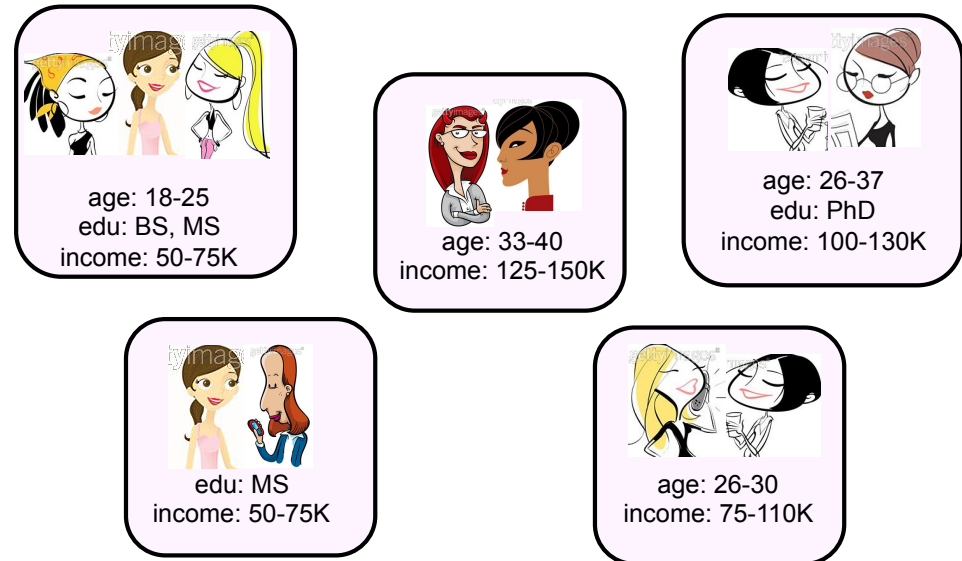

MBA, 40 years old  
makes \$150K

... 999 matches

PhD, 36 years old  
makes \$100K

... 9999 matches

BS, 27 years old  
makes \$80K

age: 18-25  
edu: BS, MS  
income: 50-75K

age: 33-40  
income: 125-150K

age: 26-37  
edu: PhD  
income: 100-130K

edu: MS  
income: 50-75K

age: 26-30  
income: 75-110K

More diverse items seen, and liked, by users

**Users are more engaged with the system**

# Diversity & friends

- For a given user consuming information in search and recommendation, relevance is important, but so are:
  - **diversity** - avoid returning similar items
  - **novelty** - avoid returning known items
  - **serendipity** - surprise the user with unexpected items
- For a set of users
  - uncommon information needs must be met: **less popular** “in the tail” queries constitute the overwhelming majority
  - lack of diversity can lead to **exclusion**

**Jonas Lerman:** “... the nonrandom, systematic omission of people who live on big data’s margins, whether due to poverty, geography, or lifestyle...”

# Diversity when data is about people

- Data must be **representative** - bias in data collection may be amplified in data analysis, perpetuating the original bias
- In this sense diversity is related to **coverage**

# Data, responsibly

Because of its tremendous **power**, massive data analysis must be used **responsibly**

Fairness

Diversity

Transparency

**and now transparency**

# Racially identifying names

racially identifying names trigger ads suggestive of an arrest record

# Transparency and accountability

- Users and regulators must be able to **understand** how raw data was selected, and what operations were performed during analysis
- Users want to **control** what is recorded about them and how that information is used
- Users must be able to **access** their own information and correct any errors (US Fair Credit Reporting Act)
- **Transparency** facilitates **accountability** - verifying that a service performs as it should, and that data is used according to contract
- Related to **neutrality**, more on this later

**the problem is broad, we focus on a specific case**

# Example: Ad targeting online

- **Users** browse the Web, consume content, consume ads (see / click / purchase)
- **Content providers** outsource advertising to third-party ad networks, e.g., Google's DoubleClick
- **Ad networks** track users across sites, to get a global view of users' behaviors
- **Google Ad Settings** aims to provide **transparency** / give **control to users** over the ads that they see

**do users truly have transparency / choice or is this a placebo button?**

# Google Ads Settings

Your Google profile

Gender

Age

Ads based on your interests

Improve your ad experience when you are signed in to Google sites

## With Ads based on your interests ON

- The ads you see will be delivered based on your prior search queries, the videos you've watched on YouTube, as well as other information associated with your account, such as your age range or gender
- On some Google sites like YouTube, you will see ads related to your interests, which you can edit at any time by visiting this page
- You can block some ads that you don't want to see

## With Ads based on your interests OFF

- You will still see ads and they may be based on your general location (such as city or state)
- Ads will not be based on data Google has associated with your Google Account, and so may be less relevant
- You will no longer be able to edit your interests
- All the advertising interests associated with your Google Account will be deleted

<http://www.google.com/settings/ads>

# Google Ads Settings

Julia

## Control your Google ads

You can control the ads that are delivered to you based on your Google Account, across devices, by editing these settings. These ads are more likely to be useful and relevant to you.

### Your interests

- Action & Adventure Films
- Cooking & Recipes
- History
- Hygiene & Toiletries
- Mobile Phones
- Phone Service Providers
- Reggaeton
- Vehicle Brands

?

+ ADD NEW INTEREST

WHERE DID THESE COME FROM?

- Cats ?

- Hybrid & Alternative Vehicles ?
- Make-Up & Cosmetics
- Parenting
- Recording Industry
- Search Engine Optimization & Marketing

These interests are derived from your activity on Google sites, such as the videos you've watched on YouTube. This does not include Gmail interests, which are used only for ads within Gmail. [Learn more](#)

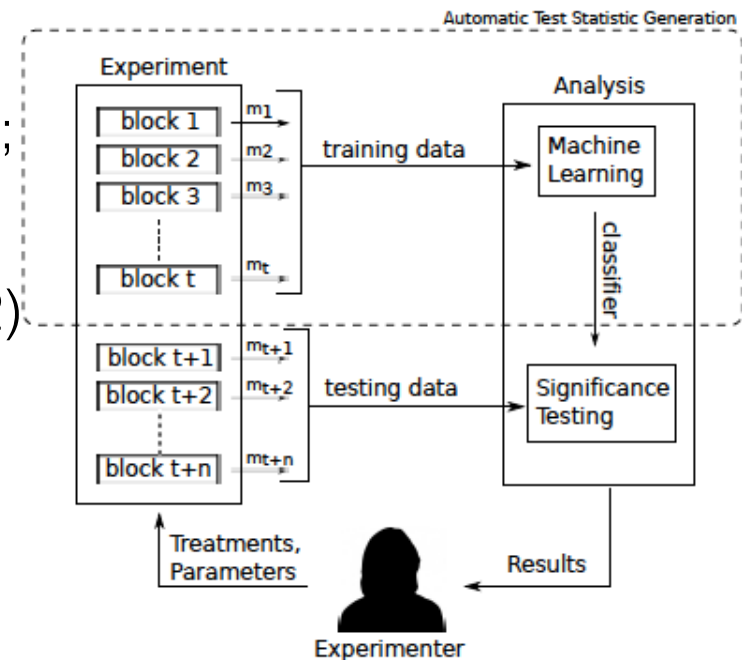

<http://www.google.com/settings/ads>

# AdFisher: methodology

[Amit Datta, Michael C. Tschantz, Anupam Datta; *PETS 2015*]

- Browser-based experiments, simulated users
  - **input:** (1) visits to content providing websites; (2) interactions with Google Ad Settings
  - **output:** (1) ads shown to users by Google; (2) change in Google Ad Settings
- Fisher randomized hypothesis testing
  - **null hypothesis** inputs do not affect outputs
  - control and experimental treatments
  - AdFisher can help select a test statistic

# AdFisher: discrimination

[Amit Datta, Michael C. Tschantz, Anupam Datta; *PETS 2015*]

**Non-discrimination:** Users differing only in protected attributes are treated similarly

**Causal test:** Find that a protected attribute changes ads

## Experiment 1: **gender and jobs**

Specify gender (male/female) in Ad Settings, simulate interest in jobs by visiting employment sites, collect ads from Times of India or the Guardian

Result: males were shown ads for higher-paying jobs significantly more often than females (1852 vs. 318)

**violation**

# AdFisher: transparency

[Amit Datta, Michael C. Tschantz, Anupam Datta; *PETS 2015*]

**Transparency:** User can view data about him used for ad selection

**Causal test:** Find attribute that changes ads but not settings

## Experiment 2: **substance abuse**

Simulate interest in substance abuse in the experimental group but not in the control group, check for differences in Ad Settings, collect ads from Times of India

Result: no difference in Ad Settings between the groups, yet significant differences in what ads are served: rehab vs. stocks + driving jobs

**violation**

# AdFisher: accountability

[Amit Datta, Michael C. Tschantz, Anupam Datta; *PETS 2015*]

**Ad choice:** Removing an interest decreases the number of ads related to that interest.

**Causal test:** Find that removing an interest causes a decrease in related ads

## Experiment 3: **online dating**

Simulate interest in online dating in both groups, remove “Dating & Personals” from the interests on Ad Settings for experimental group, collect ads

Result: members of experimental group do not get ads related to dating, while members of the control group do

**compliance**

# Power comes with responsibility

## power

A handful of big players command most of the world's computational resources and most of the data, including all of your personal data - an **oligopoly** (def: a state of limited competition, in which a market is shared by a small number of producers or sellers)

## danger

- can destroy business competition
- control what information you receive
- can guide your decisions
- can infringe on your privacy and freedom
